

COMPETENCY-FOCUSED PRACTICE QUESTIONS

ISC-CLASS XII

PHYSICS

PREFACE

With a growing emphasis on competency-based education globally, the educational landscape in India has also steered towards high-quality learning experiences that allow learners to incorporate critical thinking and problem-solving approaches. This approach goes beyond rote memorisation and focuses on developing the skills and knowledge that students need to apply in their real-world scenarios.

The Council for the Indian School Certificate Examinations (CISCE), as a national-level progressive examination board, has taken several steps to infuse competency-based education in CISCE schools through teacher capacity-building on item development for competency-based assessments and the incorporation of competency-focused questions at the ICSE and ISC levels from the examination year 2024.

To further facilitate the adoption of competency-based assessment practices in schools and to support teachers and students towards the preparation for attempting higher-order thinking questions in future board examinations, Item Banks of **Competency-Focused Practice Questions** for selected subjects at the ICSE and ISC levels have been developed. This Item Bank consists of a rich variety of questions, both objective and subjective in categories, aimed at enhancing the subject-specific critical and analytical thinking skills of the students.

In this Item Bank, each question is accompanied by the topic and cognitive learning domain/s that it intends to capture. The cognitive domains reflected in these questions include understanding, analysis, application, evaluation and creativity, along with some questions of the higher-order recall domain. The Answer Key at the end presents the possible answers to a given question, but it is neither limiting nor exhaustive.

These practice questions are also meant to serve as teacher resources for classroom assignments and as samplers to develop their own repository of competency-focused questions. Apart from offering a good practice of higher-order thinking skills, engaging with these questions would allow students to gauge their own subject competencies and use these *assessments for learning* to develop individual learning pathways.

During the development of this Item Bank, a large pool of questions was prepared by a team of experienced CISCE teachers. The questions that were finalised by the internal and external reviewers as being higher-order competency-focused questions have been collated in this item bank.

I acknowledge and appreciate all the ICSE and the ISC subject matter experts who have contributed to the development and review of these high-quality competency-focused questions for CISCE students.

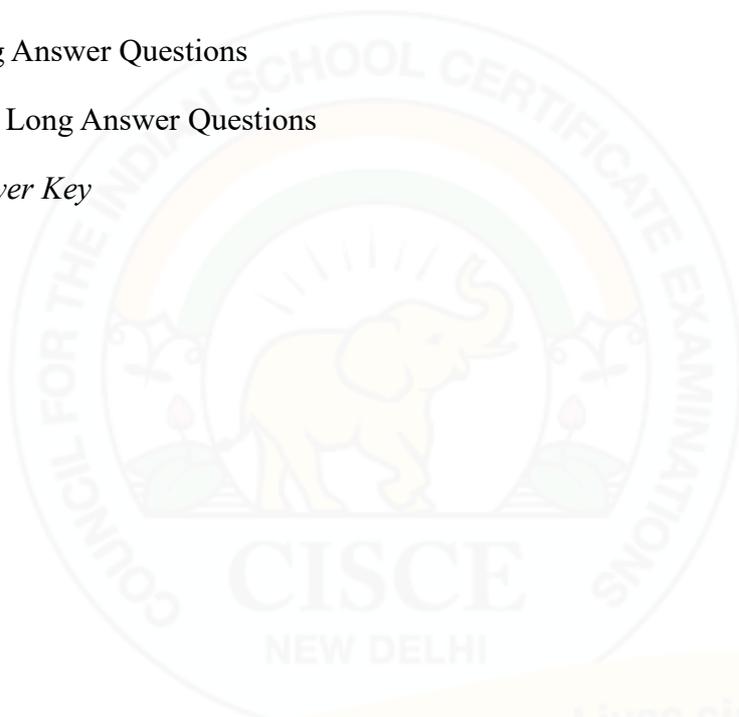

We are hopeful that teachers and students will utilise these questions to support their teaching-learning processes.

August 2024

Dr. Joseph Emmanuel
Chief Executive & Secretary
CISCE

COMPETENCY-FOCUSED PRACTICE QUESTIONS**ISC-CLASS XII****Physics****I: Multiple Choice Questions****(1 Mark Each)**

S.No.	Questions												
1.	<p><i>[Optics]</i></p> <p>Three lenses L_1, L_2, and L_3 are specified in the given table below. To construct an astronomical telescope, which one of the following is to be used as an eyepiece and as an objective?</p> <table border="1"><thead><tr><th>Lens</th><th>Aperture (cm)</th><th>Power (D)</th></tr></thead><tbody><tr><td>L_1</td><td>8</td><td>3</td></tr><tr><td>L_2</td><td>1</td><td>10</td></tr><tr><td>L_3</td><td>1</td><td>6</td></tr></tbody></table> <p>(a) L_1, L_2 (b) L_2, L_1 (c) L_2, L_3 (d) L_3, L_1</p> <p style="text-align: right;">(Analysis)</p>	Lens	Aperture (cm)	Power (D)	L_1	8	3	L_2	1	10	L_3	1	6
Lens	Aperture (cm)	Power (D)											
L_1	8	3											
L_2	1	10											
L_3	1	6											
2.	<p><i>[Magnetic Effects of Current and Magnetism]</i></p> <p>An ideal Moving Coil Galvanometer (MCG) cannot be used as an ammeter to measure the value of current in a given circuit. The following reasons are:</p> <p>(i) it has a high current sensitivity value. (ii) for a minimal amount of current the galvanometer deflection will be maximum. (iii) it has a low least count.</p> <p>(a) (i) and (ii) (b) (i) and (iii) (c) (ii) and (iii) (d) (i), (ii), and (iii)</p> <p style="text-align: right;">(Analysis)</p>												

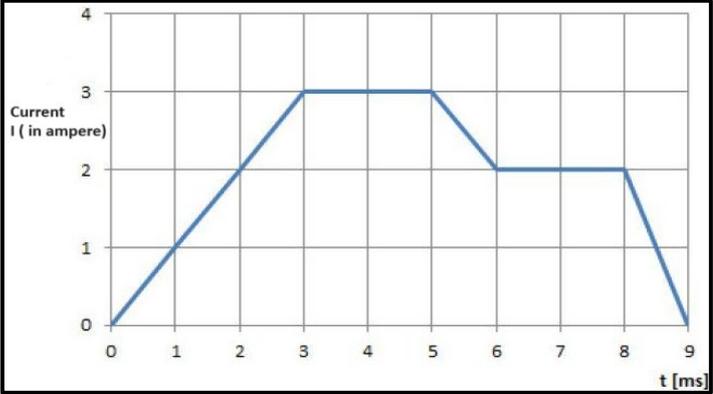

S.No.	Questions
<p>3.</p>	<p>[Electronic Devices]</p> <p>What will be the output for the given circuit?</p> <div data-bbox="419 398 1294 801" style="border: 1px solid black; padding: 10px; margin: 10px auto; width: fit-content;"> </div> <p>(a) Zero (b)  (c)  (d) </p> <p style="text-align: right; color: green;">(Understanding)</p>
<p>4.</p>	<p>[Electromagnetic Induction and Alternating Currents]</p> <p>The graphs shown below are for three different Inductance, Capacitance, and Resistance (LCR) circuits. Identify their nature based on the phase difference between V_s and I.</p> <div style="text-align: center;">  </div> <p>(a) Inductive, Capacitive, and Resistive. (b) Capacitive, Resistive, and Inductive. (c) Resistive, Capacitive, and Inductive. (d) Inductive, Resistive, and Capacitive.</p> <p style="text-align: right; color: green;">(Understanding)</p>

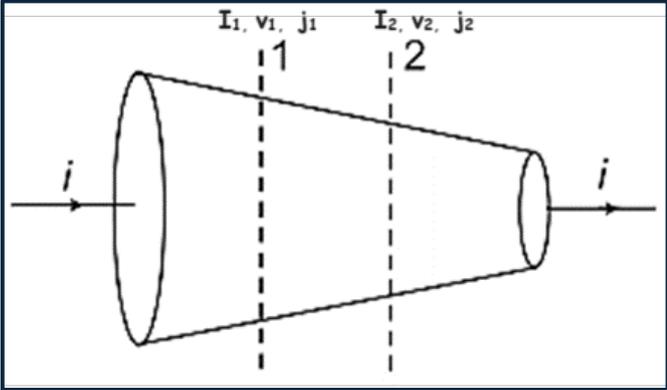

S.No.	Questions
<p>5.</p>	<p>[Current Electricity]</p> <p>Sheetal had 6 identical cells, each of electromotive force (emf) 4 V and internal resistance 'r'. She connected them to an external resistor 'R' in two different arrangements as shown and measured the current as 'I₁' and 'I₂' respectively.</p> <div style="text-align: center;">  <p>Arrangement A</p>  <p>Arrangement B</p> </div> <p>If 'I₂' is found to be greater than 'I₁', then which relation is <i>true</i>?</p> <p>(a) $R > r$ (b) $R = r$ (c) $R < r$ (d) $R = 6r$</p> <p style="text-align: right;">(Application)</p>
<p>6.</p>	<p>[Magnetic Effects of Current and Magnetism]</p> <p>Lorenz's force is:</p> <p>(a) the vector sum of electrostatic and magnetic force acting on a moving charged particle. (b) the sum of electrostatic and magnetic force acting on a moving charged particle. (c) electrostatic force acting on a charged particle only. (d) the magnetic force acting on a moving charged particle only.</p> <p style="text-align: right;">(Understanding)</p>

S.No.	Questions
7.	<p>[Magnetic Effects of Current and Magnetism]</p> <p>A charged particle is moving with velocity '\vec{v}' in a magnetic field of induction '\vec{B}'. The force on the particle will be maximum when:</p> <p>(a) '\vec{v}' and '\vec{B}' are at an angle of 45°. (b) '\vec{v}' and '\vec{B}' are perpendicular. (c) '\vec{v}' and '\vec{B}' are in the same direction i.e., at an angle of 0°. (d) '\vec{v}' and '\vec{B}' are in opposite directions i.e., at an angle of 180°.</p> <p style="text-align: right;">(Analysis)</p>
8.	<p>[Magnetic Effects of Current and Magnetism]</p> <p>Ampere's circuital law states that:</p> <p>(a) the line integral of a magnetic field along the boundary of the closed loop is equal to μ_0 times the total current passing near the surface. (b) the line integral of a magnetic field along the boundary of the closed loop is equal to μ_0 times the total current passing through the surface. (c) the surface integral of the magnetic field over the closed loop is equal to μ_0 times the total current passing through the surface. (d) the surface integral of the magnetic field over the closed loop is equal to μ_0 times the total current passing near the surface.</p> <p style="text-align: right;">(Recall)</p>
9.	<p>[Electromagnetic Induction and Alternating Currents]</p> <p>The magnetic induction at any point due to a long straight wire carrying a current is:</p> <p>(a) inversely proportional to the distance from the wire. (b) inversely proportional to the square of the distance from the wire. (c) does not depend on distance. (d) proportional to the distance from the wire.</p> <p style="text-align: right;">(Recall)</p>
10.	<p>[Atoms and Nuclei]</p> <p>The energy of an electron in the ground state of a hydrogen atom is -13.6 eV. What will be the ratios of energies in the first orbit to that in the second orbit, if the radius of the first orbit is r_1 and the second radius is r_2?</p> <p>(a) $r_1^2 : r_2^2$ (b) $r_1 : r_2$ (c) $r_2 : r_1$ (d) $r_2^2 : r_1^2$</p> <p style="text-align: right;">(Application)</p>

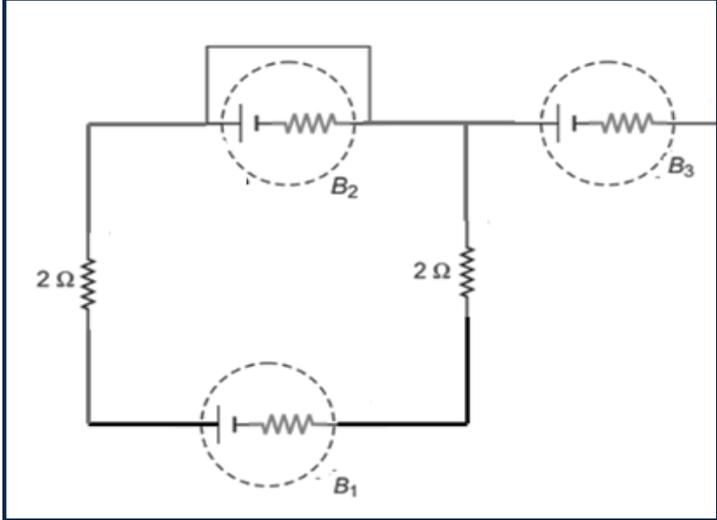

S.No.	Questions
11.	<p>[Atoms and Nuclei]</p> <p>Which of the following is NOT a limitation of Bohr's theory?</p> <p>(a) It does not include the electrical forces between electrons which necessarily appear in multi-electron atoms.</p> <p>(b) The model is unable to explain the relative intensities of the frequencies in the spectrum.</p> <p>(c) In a hydrogen atom, an electron revolves in certain stable orbits without the emission of radiant energy.</p> <p>(d) It cannot explain the characteristic line spectra of atoms of different elements.</p> <p style="text-align: right;">(Analysis)</p>
12.	<p>[Dual Nature of Radiation and Matter]</p> <p>It was found that certain metals like Zinc, Cadmium, Magnesium, etc. are photosensitive only to ultraviolet light. However, some alkali metals such as Lithium, Sodium, and Potassium, were photosensitive even to visible light.</p> <p>If ultraviolet light of the same frequency and the same intensity is incident on Zinc and Sodium metal, then which of the following quantities may be the same?</p> <p>(a) Kinetic energy of the photoelectrons emitted by the two metals.</p> <p>(b) Photoelectric current flowing through the two metals.</p> <p>(c) Stopping potential.</p> <p>(d) The potential energy of the photoelectrons emitted by the two metals.</p> <p style="text-align: right;">(Analysis)</p>
13.	<p>[Electromagnetic Induction and Alternating Currents]</p> <p>An alternating current (a.c.) voltage source at 50 Hz is applied to a series combination of resistor A of resistance 'P' and component B of reactance 'Y'. The phase angle is $+\frac{\pi}{4}$.</p> <p>Which of the following is <i>true</i>?</p> <p>(a) B is a capacitor and $Y = 2P$.</p> <p>(b) B is an inductor and $Y = 2P$.</p> <p>(c) B is a capacitor and $Y = P$.</p> <p>(d) B is an inductor and $Y = P$.</p> <p style="text-align: right;">(Analysis)</p>

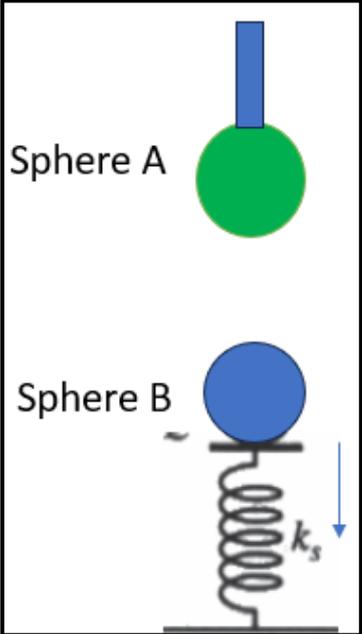

S.No.	Questions
14.	<p>[Electromagnetic Induction and Alternating Currents]</p> <p>Consider an alternating current (a.c.) source whose angular frequency (ω) changes constantly but has a fixed peak voltage 'V'. This source is connected to an ideal capacitor (C) and electric bulb of resistance 'R'. When (ω) starts to reduce gradually, then which of the following condition happens?</p> <p>(a) The bulb starts to dim. (b) The bulb starts to glow brighter than before. (c) The brightness of the bulb is independent of changes in (ω). (d) The bulb will fuse out.</p> <p style="text-align: right;">(Application)</p>
15.	<p>[Electromagnetic Waves]</p> <p>The speed of electromagnetic waves in free space is given by (in usual notations):</p> <p>(a) $\sqrt{\epsilon_0\mu_0}$ (b) $\frac{1}{\sqrt{\epsilon_0\mu_0}}$ (c) $\sqrt{\epsilon\mu}$ (d) $\frac{1}{\sqrt{\epsilon\mu}}$</p> <p style="text-align: right;">(Recall)</p>
16.	<p>[Electromagnetic Waves]</p> <p>Which of the following statement is <i>true</i>?</p> <p>(a) According to both Maxwell's electromagnetic theory and Huygens's wave theory, light is treated as a wave in nature and requires a medium to travel. (b) According to both Maxwell's electromagnetic theory and Huygens's wave theory, light is treated as a particle in nature and requires a medium to travel. (c) According to both Maxwell's electromagnetic theory and Huygens's wave theory, light is treated as a wave in nature and does not require a medium to travel. (d) According to Maxwell's electromagnetic theory, light is treated as a wave in nature and requires no medium to travel. However, according to Huygens's theory, light is treated as a wave in nature and requires a medium to travel.</p> <p style="text-align: right;">(Recall)</p>

II. Assertion-Reason Questions

(1 Mark Each)

S.No.	Questions
22.	<p><i>[Electrostatics]</i></p> <p>The diagram below shows the equipotential surfaces in a given region of space. The potential difference between any two consecutive surfaces is equal. There are five points marked in the space, namely A, B, C, D, and E as shown.</p>  <p>Assertion (A): The electric field strength is greatest at point A and reduces from A to E.</p> <p>Reason (R): The potential difference in a region of space is equal to the negative electric field gradient in that region.</p> <p>(a) Both Assertion and Reason are true, and Reason is the correct explanation for Assertion.</p> <p>(b) Both Assertion and Reason are true, but Reason is not the correct explanation for Assertion.</p> <p>(c) Assertion is true, and Reason is false.</p> <p>(d) Both Assertion and Reason are false. (Analysis)</p>
23.	<p><i>[Magnetic Effects of Current and Magnetism]</i></p> <p>Assertion (A): In a ferromagnetic material, all the atomic magnets have dipole moments in the same direction.</p> <p>Reason (R): It is due to strong exchange coupling between neighbouring atoms in a domain.</p> <p>(a) Both Assertion and Reason are true, and Reason is the correct explanation for Assertion.</p> <p>(b) Both Assertion and Reason are true, but Reason is not the correct explanation for Assertion.</p> <p>(c) Assertion is false, and Reason is true.</p> <p>(d) Both Assertion and Reason are false. (Understanding)</p>

S.No.	Questions
24.	<p>[Optics]</p> <p>Assertion (A): The graph for 'v' versus 'u' of a concave mirror forming real images, falls within the second quadrant.</p> <p>Reason (R): For concave mirrors, according to the sign convention for real images, 'u' is negative, and 'v' is positive.</p> <p>(a) Both Assertion and Reason are true, and Reason is the correct explanation for Assertion.</p> <p>(b) Both Assertion and Reason are true, but Reason is not the correct explanation for Assertion.</p> <p>(c) Assertion is true, and Reason is false.</p> <p>(d) Both Assertion and Reason are false. (Application)</p>
25.	<p>[Atoms and Nuclei]</p> <p>Assertion (A): The wave nature of matter is what prevents atoms from collapsing and gives atoms their sizes.</p> <p>Reason (R): Only those orbits where the circumference of the orbit is an integral multiple of de Broglie wavelength exist or are “allowed.” And it is not possible lower than the lowest orbit in an atom.</p> <p>(a) Both Assertion and Reason are true, and Reason is the correct explanation for Assertion.</p> <p>(b) Both Assertion and Reason are true, but Reason is not the correct explanation for Assertion.</p> <p>(c) Assertion is true, and Reason is false.</p> <p>(d) Both Assertion and Reason are false. (Analysis)</p>

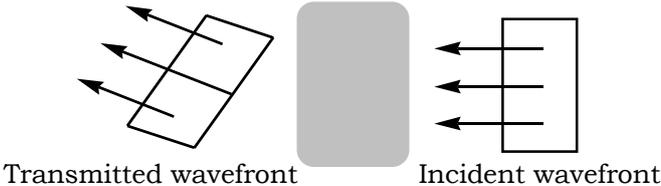

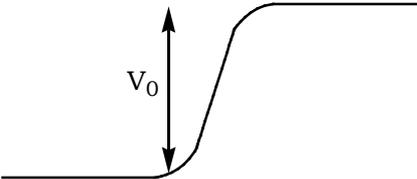

III: Very Short Answer Questions

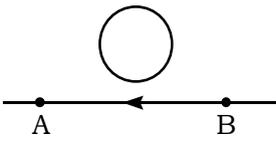

(1 Mark Each)

S.No.	Questions
26.	<p><i>[Electrostatics]</i></p> <p>The given graph shows the variation of charge on plates (q) versus the potential difference (V) between the plates of two capacitors C_1 and C_2. Both the capacitors have the same plate area but the plate separation of C_1 is twice that of C_2. Which graph corresponds to C_1?</p> <div data-bbox="770 712 983 920" style="text-align: center;"> </div> <p style="text-align: right;">(Analysis)</p>
27.	<p><i>[Electrostatics]</i></p> <p>A hollow sphere made of material 'X' is placed in a region of electric field. The pattern of electric field lines around the sphere is observed to be like the figure shown below.</p> <div data-bbox="695 1167 1066 1424" style="text-align: center;"> </div> <p>Plot the resistivity versus temperature graph for the material of the sphere. (Analysis)</p>

S.No.	Questions
<p>28.</p>	<p>[Electrostatics]</p> <p>Four charges $+Q$, $+Q$, $-Q$, and $-Q$ are placed in an arrangement as shown. The direction of the net electric field at a point 'P' (on the diagram) is best indicated by which of the following vectors: A, B, C, D, or E?</p> <div data-bbox="646 450 1117 907" data-label="Diagram"> </div> <p style="text-align: right;">(Understanding)</p>
<p>29.</p>	<p>[Electrostatics]</p> <p>Using a cell of electromotive force (e.m.f.) ϵ and internal resistance 'r', a student designs an electrical circuit to calculate current 'I' through a variable resistor 'R'. The student plots her findings on a graph as shown.</p> <div data-bbox="718 1198 1029 1411" data-label="Figure"> </div> <p>What does the slope of the graph indicate?</p> <p style="text-align: right;">(Evaluate)</p>

S.No.	Questions
30.	<p>[Magnetic Effects of Current and Magnetism]</p> <p>A finite-length Movable wire (XY) carrying current i_1 is kept parallel to another infinite-length Fixed wire (PQ) carrying current i_2 above it. In this setup, the Movable wire (XY) is stationary as depicted below.</p> <div data-bbox="584 472 1177 853" style="text-align: center;"> </div> <p>Redraw a new setup such that the Movable wire (XY) remains stationary and is placed parallel below the Fixed wire (PQ) carrying current i_2. Label the direction of current i_1 in the Movable wire (XY). (Create)</p>
31.	<p>[Magnetic Effects of Current and Magnetism]</p> <p>A charge $10 \mu\text{C}$ enters a region of the uniform magnetic field with a velocity $(4i + 5j)$ m/s and experiences a force $(5i - Cj)$ N. Find the value of 'C'. (Analysis & Evaluate)</p>
32.	<p>[Magnetic Effects of Current and Magnetism]</p> <p>A galvanometer of resistance 3G can carry a maximum current of 25 mA. Calculate the value of shunt resistance to be used so that it works as an ammeter to read the current up to 0.1 A. (Application)</p>
33.	<p>[Magnetic Effects of Current and Magnetism]</p> <p>In the X - Y plane, a magnetic field of 4 T is applied along the Y-axis. Calculate the magnetic force on a proton, if it moves at $3 \times 10^6 \text{ m/s}$ along the +Y-axis. (Application)</p>
34.	<p>[Optics]</p> <p>How is the refractive index of the material of a prism dependent on the angle of incidence? (Understanding)</p>

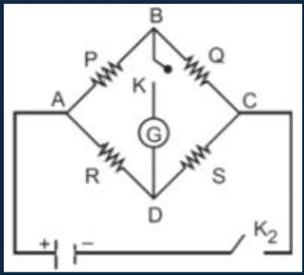

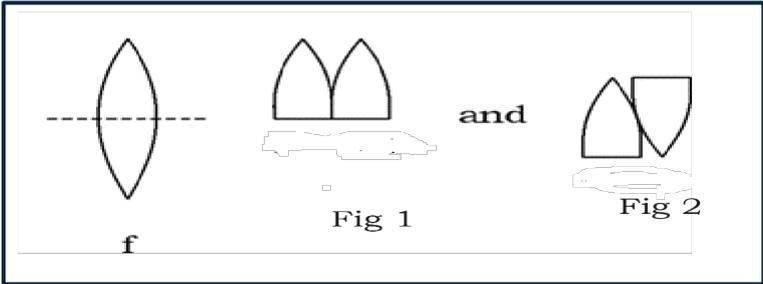

S.No.	Questions
35.	<p>[Optics]</p> <p>If you had to construct an optical fibre using the two materials, which would you prefer for the core and the cladding? X: with a refractive index of 1.4905 or Y: of refractive index of 1.337?</p> <p style="text-align: right;">(Analysis)</p>
36.	<p>[Optics]</p> <p>A lens forms the image of an object as shown in the figure. Identify the type of lens.</p> <div style="text-align: center;">  </div> <p style="text-align: right;">(Application)</p>
37.	<p>[Optics]</p> <p>Redraw the diagram with the correct orientation of the obscured (hidden) optical device, so that when a plane wavefront is incident upon it, the transmitted wavefront matches the depicted figure.</p> <div style="text-align: center;">  </div> <p style="text-align: right;">(Create)</p>
38.	<p>[Electronic Devices]</p> <p>A light-emitting diode (LED) is connected in forward biasing. If its potential barrier is given by 'V_0' when no biasing is there, as shown in the diagram, then draw the diagram showing the new position of potential barrier.</p> <div style="text-align: center;">  </div> <p style="text-align: right;">(Understanding)</p>
39.	<p>[Dual Nature of Radiation and Matter]</p> <p>An electron is revolving around the nucleus of a hydrogen atom. If the radius of the first orbit is 0.53×10^{-10} m, calculate the de Broglie wavelength of the moving electron in the orbit.</p> <p style="text-align: right;">(Application)</p>

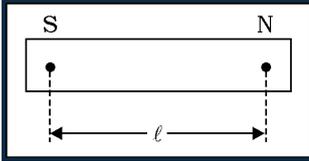

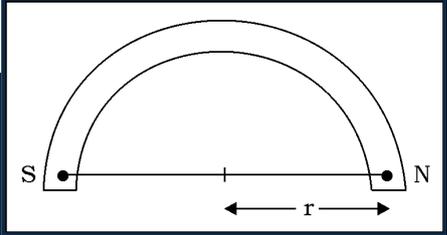

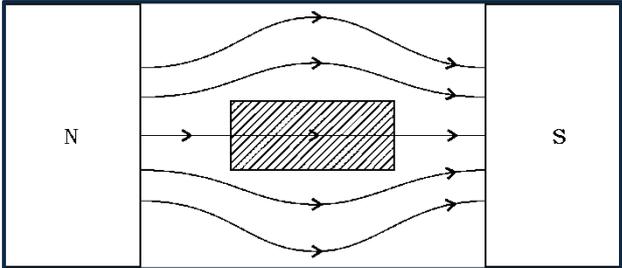

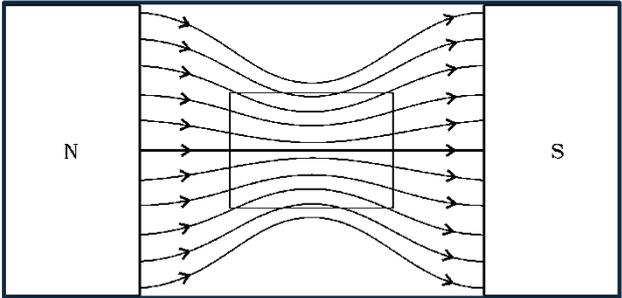

S.No.	Questions
40.	<p><i>[Atoms and Nuclei]</i></p> <p>A 9.2 eV electron beam is used to bombard gaseous hydrogen at room temperature. What series of wavelengths will be emitted if any? (Application)</p>
41.	<p><i>[Dual Nature of Radiation and Matter]</i></p> <p>Calculate the wavelength of a photon needed to ionize a hydrogen atom. (Application)</p>
42.	<p><i>[Atoms and Nuclei]</i></p> <p>The kinetic energy of an α-particle incident on a gold foil is doubled. How does the distance of the closest approach change? (Application)</p>
43.	<p><i>[Magnetic Effects of Current and Magnetism]</i></p> <p>The electric current flowing in a wire in the direction B to A is decreasing. What is the direction of the induced current in the metallic loop kept above the wire, as shown in the figure?</p> <div style="text-align: center;">  </div> <p style="text-align: right;">(Analysis)</p>
44.	<p><i>[Magnetic Effects of Current and Magnetism]</i></p> <p>A circular coil of radius 8 cm and 20 turns rotates about its vertical diameter with an angular speed of 50 s^{-1} in a uniform horizontal magnetic field of magnitude $3 \times 10^{-2} \text{ T}$. Obtain the average electromotive force (e.m.f.) induced in the coil in each rotation. (Evaluate)</p>
45.	<p><i>[Electromagnetic Induction and Alternating Currents]</i></p> <p>Give the expression for the power factor in an LR circuit in terms of the resistance 'R' and inductive reactance 'X_L'. (Recall)</p>

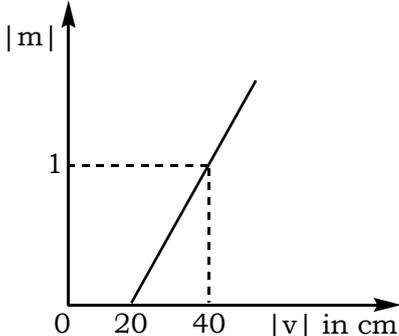

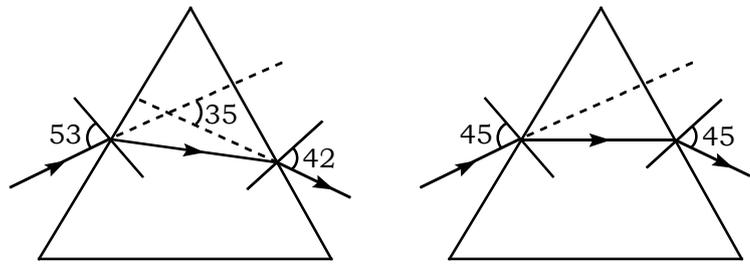

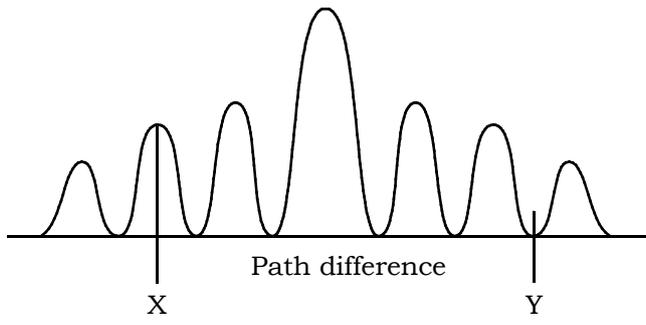

IV: Short Answer Questions

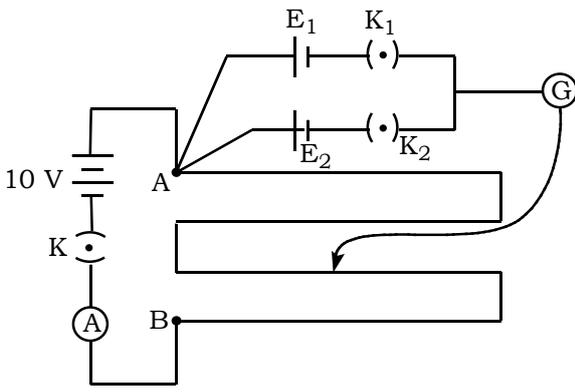

(2 Marks Each)

S.No.	Questions										
<p>46.</p>	<p>[Electromagnetic Induction and Alternating Currents]</p> <p>Two long wires carrying current are kept crossed (not touching each other) as shown in figure. If resultant magnetic induction at P is zero, then find the relation between I_1 and I_2.</p> <div data-bbox="700 645 1058 1032" data-label="Diagram"> </div> <p style="text-align: right;">(Application)</p>										
<p>47.</p>	<p>[Optics]</p> <p>Which material is used to make this glass slab?</p> <table border="1" data-bbox="691 1279 1082 1491"> <thead> <tr> <th>Material</th> <th>Refractive Index</th> </tr> </thead> <tbody> <tr> <td>Zircon</td> <td>1.96 – 2.01</td> </tr> <tr> <td>Sapphire</td> <td>1.76 – 1.77</td> </tr> <tr> <td>Peridot</td> <td>1.65 – 1.69</td> </tr> <tr> <td>Tourmaline</td> <td>1.62 – 1.64</td> </tr> </tbody> </table> <div data-bbox="641 1514 1121 1944" data-label="Diagram"> </div> <p style="text-align: right;">(Analysis)</p>	Material	Refractive Index	Zircon	1.96 – 2.01	Sapphire	1.76 – 1.77	Peridot	1.65 – 1.69	Tourmaline	1.62 – 1.64

S.No.	Questions
<p>57.</p>	<p>[Current Electricity]</p> <p>Two cells of electromotive forces (e.m.f.s.) approximately 5 V and 10 V are to be accurately compared using a potentiometer of length 400 cm. The student sets up the circuit as shown in the diagram. However, he is not able to measure the ratio of e.m.f.s correctly. Analyse the circuit shown and spot a minimum of <i>two</i> errors in the circuit. Explain with proper reasoning.</p>  <p style="text-align: right;">(Analysis)</p>
<p>58.</p>	<p>[Electrostatics]</p> <p>A student wants to place three charges ‘$-q$’, ‘Q’, and ‘$-q$’ in such a way that the potential energy of the system is zero. The three charges are arranged in a straight line at an equal distance from each other. Calculate the ratio of ‘Q’ to ‘q’ for such an arrangement.</p> <p style="text-align: right;">(Evaluate)</p>

S.No.	Questions
59.	<p>[Current Electricity]</p> <p>The student sets up an experiment in the lab to determine the internal resistance of a cell by graphical method. The setup of the circuit is done as shown below using a cell of e.m.f. 'E' and internal resistance 'r', a variable resistor 'R', and a milliammeter. A voltmeter 'V' is connected to the circuit as shown.</p> <div data-bbox="624 517 1139 862" style="text-align: center;"> </div> <p>(a) Draw the nature of the graph so determined. What does the Y-intercept of the graph represent?</p> <p>(b) How can internal resistance be calculated from the graph?</p> <p style="text-align: right;">(Evaluate)</p>
60.	<p>[Dual Nature of Radiation and Matter]</p> <p>Images produced by positron emitters have become important in recent years. When the emitted positron (β^+) encounters an electron, mutual annihilation occurs, producing two γ-rays. These rays have identical 0.511 MeV energies and they move directly away from one another, allowing detectors to determine their point of origin accurately. The system is called positron emission tomography (PET). It requires detectors on opposite sides to simultaneously (i.e., at the same time) detect photons of 0.511-MeV energy and utilises computer imaging techniques similar to those in SPECT and computed tomography (CT) scans. Its resolution of 0.5 cm is better than that of Single-photon emission computed tomography (SPECT); the accuracy and sensitivity of PET scans make them useful for examining the brain's anatomy and function.</p> <p>(a) Why two 'γ' photons are produced?</p> <p>(b) Why energy of each produced 'γ' photon is 0.511 MeV?</p> <p style="text-align: right;">(Application)</p>
61.	<p>[Atoms and Nuclei]</p> <p>In the first atomic bomb, the energy released was equivalent to about 30 kilotons of Trinitrotoluene (TNT), where a ton of TNT releases an energy of about 4×10^9 J. Estimate the amount of mass converted into energy in this event.</p> <p style="text-align: right;">(Application)</p>

S.No.	Questions
62.	<p><i>[Atoms and Nuclei]</i></p> <p>Draw a graph showing the variation of binding energy (in eV) versus the first five principal quantum numbers in a hydrogen atom. (Application)</p>
63.	<p><i>[Electromagnetic Induction and Alternating Currents]</i></p> <p>An inductor-resistor circuit (LR) series circuit connected to an alternating current (a.c.) source of 220 V, 50 Hz, the resistor value is 11 ohms, and the power factor is $\frac{1}{\sqrt{2}}$. Calculate the value of inductance in the circuit. (Recall)</p>
64.	<p><i>[Electromagnetic Induction and Alternating Currents]</i></p> <p>The graph here shows a variation of I_{rms} with angular frequency 'ω' for two different LCR circuits. Which of the <i>two</i> will have:</p> <p>(a) lower power factor. (b) calculate resonance frequency for the two different LCR circuits.</p> <div style="text-align: center;">  </div> <p style="text-align: right;">(Application)</p>

V. Long Answer Questions

(3 Marks Each)

S.No.	Questions
66.	<p>[Magnetic Effects of Current and Magnetism]</p> <p>A synchrotron uses a combination of solenoid and toroid to generate high magnetic fields. Charged particles like electrons and protons can be accelerated to very high energies using a synchrotron. A synchrotron adjusts the magnetic field such that the particles are kept in a circular orbit. It is used to study high-energy particle collisions.</p> <p>(a) If the magnetic field is parallel to the positive Y-axis and the charged particle is moving along the positive X-axis, which way would the Lorentz force be for:</p> <p>(i) an electron.</p> <p>(ii) a proton.</p> <p>(b) An electron does not suffer any deflection while passing through a region of uniform magnetic field. What is the direction of the magnetic field?</p> <p style="text-align: right;">(Application)</p>
67.	<p>[Optics]</p> <p>Both students i.e. Student 1 and Student 2, had an intention of stargazing at night and knew that a telescope would be required for viewing distant stars. Student 1 visited a shop to purchase the necessary equipment for stargazing and purchased two lenses X and Y, the former being thicker and the latter thinner. On the other hand, Student 2 opted for a different approach. He decided to build his telescope by combining a concave mirror of focal length 25 cm and a plane mirror, along with a convex lens of focal length 5 cm.</p> <p>(a) Which lens would Student 1 use as an objective, X or Y?</p> <p>(b) Give <i>any one</i> advantage of the telescope of Student 2 over the telescope of Student 1.</p> <p>(c) What is the length of the telescope of Student 1 when the final image is formed at infinity, assuming she uses the same eyepiece as Student 2 but achieves twice the magnifying power?</p> <p style="text-align: right;">(Understanding)</p>

S.No.	Questions																											
68.	<p>[Electrostatics]</p> <p>A student starts working on a problem on Gauss' theorem to calculate the flux and hence the electric field at a given point due to a system of discrete charges. The teacher gives him certain instructions and the student responds to each instruction as per her understanding of the concept. State whether the student's response is <i>correct or incorrect</i>. Give a reason for your answer.</p> <p>(a) Examiner: Draw a Gaussian surface for the given system of charges. Student: <i>Draws a symmetric surface passing through the point at which the electric field is to be calculated.</i> Examiner: Suggest a way to double the flux through the given surface. Student: <i>Doubles the surface area of the Gaussian surface.</i></p> <p>(c) Examiner: Calculate the electric flux of a point charge of $2 \mu\text{C}$, placed 5 cm above the centre of a square plate of side 10 cm, through the given plate. Student: <i>As the charge is not enclosed by the surface, the flux through the surface is zero.</i></p> <p style="text-align: right;">(Application)</p>																											
69.	<p>[Electromagnetic Induction and Alternating Currents]</p> <p>A student was given a frequency generator, a source, an inductor, a capacitor, a resistor and an ammeter. After connecting the circuit correctly, the student tabulated the readings as shown below.</p> <table border="1" data-bbox="520 1111 1197 1543"> <thead> <tr> <th>S.No.</th> <th>Frequency(kHz)</th> <th>Ammeter reading (mA)</th> </tr> </thead> <tbody> <tr><td>1</td><td>1.20</td><td>13.8</td></tr> <tr><td>2</td><td>1.38</td><td>16.3</td></tr> <tr><td>3</td><td>1.71</td><td>19.4</td></tr> <tr><td>4</td><td>2.08</td><td>22.0</td></tr> <tr><td>5</td><td>2.39</td><td>19.5</td></tr> <tr><td>6</td><td>2.57</td><td>17.6</td></tr> <tr><td>7</td><td>2.79</td><td>16.0</td></tr> <tr><td>8</td><td>3.10</td><td>14.5</td></tr> </tbody> </table> <p>(a) What is the resonant frequency of the circuit? (b) Plot the graph for the given data using proper axes.</p> <p style="text-align: right;">(Evaluate)</p>	S.No.	Frequency(kHz)	Ammeter reading (mA)	1	1.20	13.8	2	1.38	16.3	3	1.71	19.4	4	2.08	22.0	5	2.39	19.5	6	2.57	17.6	7	2.79	16.0	8	3.10	14.5

ANSWER KEY

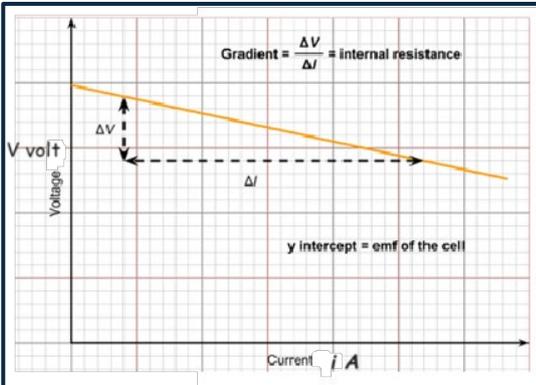

S.No.	Expected Answers
1.	(b) L_2, L_1 Explanation: The objective should have a large aperture and large focal length, while the eyepiece should have a small aperture and small focal length.
2.	(a) (i) and (ii)
3.	(b)  During the first half diode is in reverse biasing so it does not conduct, and we get the same voltage in output. But in the second half, it is in forward bias, so it conducts, hence the circuit is shortened, and we do not get any voltage in output.
4.	(b) Capacitive, Resistive and Inductive.
5.	(c) $R < r$
6.	(a) The vector sum of electrostatic and magnetic force acting on a moving charged particle. Explanation: As Lorentz force is given by, $\vec{F} = q(\vec{E} + \vec{v} \times \vec{B}) = q\vec{E} + q(\vec{v} \times \vec{B})$ $\vec{F} = \vec{F}_E + \vec{F}_B$
7.	(b) ' \vec{v}' and ' \vec{B}' ' are perpendicular. Explanation: Since $F = q(\vec{v}' \times \vec{B}')$ or $ F = qvB \sin \theta$ 'F' will be the maximum when $\theta = 90^\circ$.
8.	(b) The line integral of a magnetic field along the boundary of the closed loop is equal to μ_0 times the total current passing through the surface. Explanation: According to Ampere's circuital law, $\oint \vec{B} \cdot d\vec{\ell} = \mu_0 I$
9.	(a) inversely proportional to the distance from the wire. Explanation: $B = \frac{\mu_0 I}{2\pi r}$ or $B \propto \frac{I}{r}$

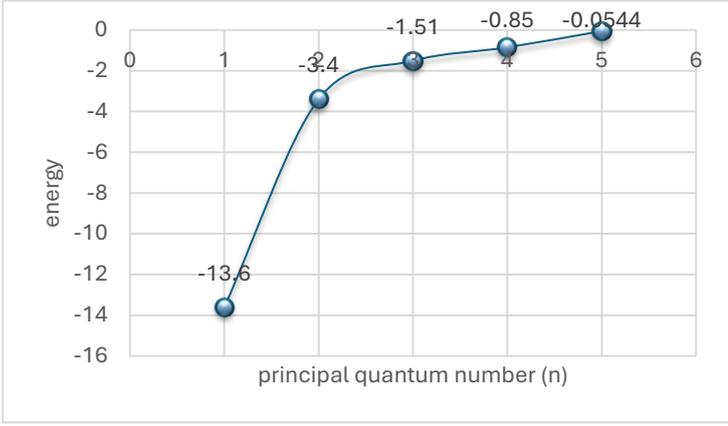

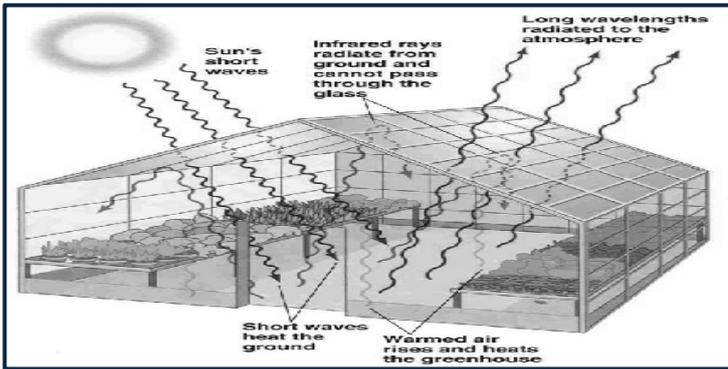

S.No.	Expected Answers
10.	(c) $r_2 : r_1$ Solution: $E = -\frac{e^2}{8\pi\epsilon_0 r}$
11.	(c) In a hydrogen atom, an electron revolves in certain stable orbits without the emission of radiant energy.
12.	(b) Photoelectric current flowing through the two metals.
13.	(c) B is a capacitor and $Y = P$.
14.	(a) The bulb starts to dim.
15.	(b) $\frac{1}{\sqrt{\epsilon_0\mu_0}}$
16.	(d) According to Maxwell's electromagnetic theory, light is treated as a wave in nature and requires no medium to travel. However, according to Huygens's theory, light is treated as a wave in nature and requires a medium to travel.
17.	(d) 10.5mC. Explanation: Under the graph
18.	(b) Current: $I_1=I_2$; Current density: $j_2 > j_1$; Drift velocity: $v_2 > v_1$
19.	(a) 0 V. Explanation: As the battery is short-circuited, the potential difference is 0 V.
20.	(b) $d_2 < d_1$ Electrons on the conducting sphere will be attracted to the excess positive charges on Sphere A and move closer to Sphere A. This leaves the opposite side of the conducting sphere more positively charged which results in less electric repulsion between the spheres and as a result, less compression in the spring.
21.	(d) Work function: 2.04 eV; Stopping Potential: -3.24V.
22.	(d) Both Assertion and Reason are false.
23.	(c) Assertion is false, and Reason is true.
24.	(d) Both Assertion and Reason are false.
25.	(a) Both Assertion and Reason are true, and Reason is the correct explanation of Assertion.

S.No.	Expected Answers
26.	<p>Slope = $qV = C$. The higher slope corresponds to higher capacitance.</p> <p>Also, $C \propto \frac{1}{d}$. The lesser the value of 'd', the more the capacitance.</p> <p>Hence, graph 'B' corresponds to 'C₁'.</p>
27.	<p>Conductor</p> 
28.	C
29.	$\text{Slope} = \frac{1}{\epsilon}$
30.	
31.	<p>As we know magnetic force is always perpendicular to the velocity of the charge particle, given as $\vec{F} = q(\vec{v} \times \vec{B})$.</p> <p>As \vec{F} is perpendicular to \vec{v}, we use $\vec{F} \times \vec{v} = 0$ $\mathbf{F} \cdot \mathbf{v} = 0$</p> $(5\hat{i} - C\hat{j}) \cdot (4\hat{i} + 5\hat{j}) = 0$ $20 - 5C = 0$ $C = \frac{20}{5} = 4$
32.	G
33.	Zero
34.	It is independent of the angle of incidence.

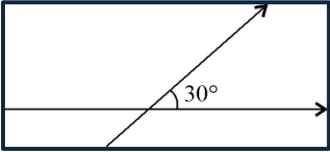

S.No.	Expected Answers
35.	X: refractive index of 1.4905: Core Y: refractive index of 1.337: Cladding
36.	Convex lens
37.	 <p style="text-align: center;">Transmitted wavefront Incident wavefront</p>
38.	 <p style="text-align: center;">New potential barrier</p>
39.	<p>According to Bohr's quantization condition, $2\pi r = n\lambda$.</p> <p>$\therefore \lambda = 2\pi r$, since $n = 1$</p> <p>$\lambda = 2 \times 3.14 \times 0.53 \times 10^{-10}$</p> <p>$= 3.328 \times 10^{-10} \text{ m.}$</p>
40.	No series. (At room temperature electrons remain present in the ground state.)
41.	$\lambda = \frac{hc}{E} = \frac{6.6 \times 10^{-34} \times 3 \times 10^8}{13.6 \times 1.6 \times 10^{-19}} = 909.9 \times 10^{-10} \text{ m}$
42.	K.E. $\propto \frac{1}{r_0}$, where ' r_0 ' is the distance of closest approach. So, when the kinetic energy is doubled, the distance of the closest approach is halved.
43.	By right-hand thumb rule, the magnetic field of the current in wire AB acts on the loop in a direction perpendicular to the plane of paper and inwards. By Lenz's law, the induced current should oppose the decrease in flux, i.e., it should also produce inward flux. So, the induced current flows in the clockwise direction.
44.	$\varepsilon = NBA\omega \sin \omega t = \varepsilon_0 \sin \omega t$ <p>Since the average value of $\sin \omega t$ over a cycle is zero, therefore, $\varepsilon_{av} = 0$.</p>
45.	$\cos \theta = \frac{R}{\sqrt{R^2 + X_L^2}}$

S.No.	Expected Answers
46.	$\vec{B}_P = \vec{B}_1(\text{in}) + \vec{B}_2(\text{out})$ $B_P = B_1 - B_2 = \frac{\mu_0 2I_1}{4\pi x} - \frac{\mu_0 2I_2}{4\pi y}$ <p>The resultant magnetic field induction at point P is 0.</p> $0 = \frac{\mu_0 2I_1}{4\pi x} - \frac{\mu_0 2I_2}{4\pi y}$ $\frac{\mu_0 2I_1}{4\pi x} = \frac{\mu_0 2I_2}{4\pi y}$ $\therefore \frac{I_1}{I_2} = \frac{x}{y}$
47.	$\text{Lateral disp} = \frac{t \sin(i - r)}{\cos r} \rightarrow \cos r = \frac{10 \times 0.5}{5.7} = 0.8772 \rightarrow r = 28.69^\circ$ $\text{Refractive index} = \frac{\sin i}{\sin r} = \frac{\sin 58.69}{\sin 28.69} = 1.77$ <p>The material is sapphire.</p>
48.	$\frac{P}{Q} = \frac{R}{S} = \frac{R(S_1 + S_2)}{S_1 S_2}$
49.	<p>(a) $F = f/2$ (b) $F = \infty$</p>
50.	<p>When the velocity of the charged particle is E/B. Then, $p = \frac{E}{c}$ proves that e.m. waves carry both energy and momentum.</p>
51.	$M = m \times \ell$ <p>After bending, the new separation between the poles = $2r$.</p> <p>Now, $\pi r = \ell$</p> $\therefore r = \frac{\ell}{\pi}$ <p>New dipole moment, $M_1 = m \times 2r = m \times \frac{2\ell}{\pi}$</p> $\therefore M_1 = \frac{2M}{\pi}$
52.	<p>Figure 1 – Diamagnetic Figure 2 – Ferromagnetic</p>

S.No.	Expected Answers
53.	<p>$I = 50 \text{ A}, r = 2.5 \text{ m}$</p> $B = \frac{\mu_0 2I}{4\pi r} = \frac{4\pi \times 10^{-7} \times 50}{2\pi \times 2.5} = 4 \times 10^{-6} \text{ T}$ <p>Applying the right-hand thumb rule, we find the magnetic field will be perpendicular outward at a point 2.5 m east of the power line.</p>
54.	(a) Concave mirror; (b) 20 cm
55.	<p>From the first diagram, $i + e = A + d$ $A = 53 + 42 - 35 = 60^\circ$</p> <p>From the second diagram, the angle of minimum deviation $= 2i - A = 30^\circ$</p> $\text{Refractive index} = \frac{\sin \frac{A + d}{2}}{\sin \frac{A}{2}} = \frac{\sin 45}{\sin 30} = 1.414$
56.	<p>X – 2nd order maxima $= -\frac{5\lambda}{2}$, Phase difference $= -\frac{5\lambda}{2} \times \frac{2\pi}{\lambda} = -5\pi$</p> <p>Y – 3rd minima $= 3\lambda$ Phase difference $= 3\lambda \times \frac{2\pi}{\lambda} = 6\pi$</p>
57.	<p>(i) The electromotive force (emf) of the battery must be greater than 10 V, so that the potential difference across the wire is more than the e.m.f.s of the cell to be compared. Otherwise, the balance length for 10 V cannot be determined.</p> <p>(ii) A series variable resistant/rheostat must also be added to the primary circuit to minimize the current drawn from the cell and adjust the potential drop across the potentiometer.</p>
58.	$-\frac{kqQ}{x} - \frac{kQq}{x} + \frac{kqq}{2x} = 0 \quad \text{or} \quad \frac{-2kqQ}{x} = \frac{-kqq}{2x}$ <p>Solving we get, Q: q = 1: 4</p>
59.	<p>(a)</p>  <p>Y-intercept gives the emf of the cell.</p> <p>(b) The slope of the graph = internal resistance.</p>

S.No.	Expected Answers
60.	(a) Two ‘ γ ’ photons are produced to conserve momentum. (b) Using $E = mc^2$ it can be shown that energy equivalent to mass of an electron is equal to 0.511 MeV.
61.	Using $E = mc^2$ $4 \times 10^9 \times 30 \times 10^3 = m \times (2.99792 \times 10^8)^2$ $m = \frac{4 \times 10^9 \times 30 \times 10^3}{(2.99792 \times 10^8)^2} = 1.33 \times 10^{-3} \text{ kg}$
62.	
63.	$\cos \phi = \frac{1}{\sqrt{2}} = \frac{R}{Z}$; $Z = 11\sqrt{2}$, $L = 0.035 \text{ H}$
64.	(a) For R_1 ; (b) 0.1592 Hz & 159.2 Hz
65.	Figure. 1 – Infrared rays: 
66.	Figure. 2 UV rays: Welders to protect their eyes from intense UV use welding glasses. (a) (i) -ve Z-axis for an electron. (ii) +ve Z-axis for a proton. (b) The direction of motion of the electron should be parallel to the magnetic field direction.

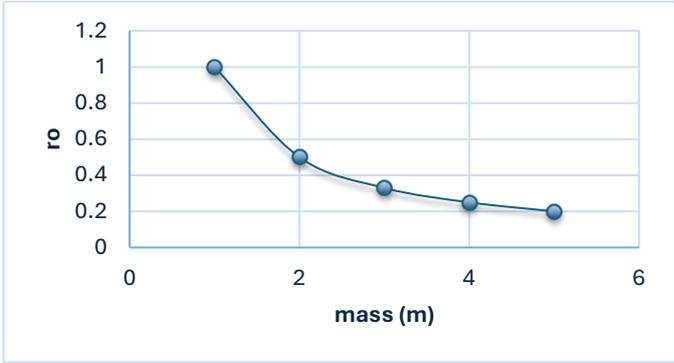

S.No.	Expected Answers
67.	<p>(a) Y</p> <p>(b) Free of chromatic aberration / Image formed is brighter / Free from spherical aberration. <i>(anyone relevant point)</i></p> <p>(c) Magnifying power of telescope of student 2 = $\frac{f_0}{f_e} = 5$ Hence, the magnifying power of the telescope of student 1 = 10. Since $f_e = 5$ cm, hence $f_0 = 50$ cm. Length = $50 + 5 = 55$ cm.</p>
68.	<p>(a) Response is correct. The Gaussian surface is an imaginary closed surface around a charge.</p> <p>(b) Response is incorrect. The electric flux does not change with the area of the Gaussian surface.</p> <p>(c) Response is incorrect. The total flux through the square plate = $\frac{1}{\epsilon_0} \left(\frac{2 \times 10^{-6}}{6} \right) = 3.77 \times 10^4 \text{ Nm}^2 / \text{C}$. <i>(Reason is to be given for both correct as well as incorrect responses.)</i></p>
69.	<p>(a) 2.08 kHz</p> <p>(b)</p> <div data-bbox="545 1122 1150 1496" style="border: 1px solid black; padding: 10px; margin: 10px auto; width: fit-content;"> </div>
70.	<p>(a) Nuclear binding energy is also energy needed to bind nucleons together in the nucleus. Therefore, energy is needed to break the nucleons' infinite distance apart OR energy is needed to work against the strong nuclear forces.</p> <p>(b) ${}_3\text{Y}^7$ is more stable as it has a greater number of neutrons as compared to ${}_3\text{X}^6$, therefore nuclear force is greater than the electrostatic force of repulsion between protons.</p> <p>(c) $E = \Delta m \cdot c^2$ $2.23 \text{ MeV} = \Delta m \times 931.5 \text{ MeV}$ $\Delta m = \frac{2.23}{931.5} = 0.00239398 \text{ u}$</p>

S.No.	Expected Answers
71.	<p>$N = 20, r = 10 \times 10^{-2} \text{ m}, B = 0.10 \text{ T}$</p> <p>(a) $\tau = \text{zero}$</p> <p>(b) $F_{\text{total}} = \text{zero}$</p> <p>(c) $F = ev_d B = e \frac{I}{neA} B = 5 \times 10^{-25} \text{ N}$</p>
72.	<p>STEP 1: $\mu_0 \underline{NI}$</p> <p>STEP 2: $B \underline{2\pi r} = \mu_0 NI$</p> <p>STEP 3: $B = \mu_0 \underline{nI}$</p>
73.	<p>(a) $\text{K.E.} = \frac{1}{2} mv^2 = eV$</p> $v = \sqrt{\frac{2eV}{m}} = 2.65 \times 10^7 \text{ m/s}$ $\frac{mv^2}{r} = qvB \sin \theta$ $\therefore r = \frac{mv}{qB} = 9.95 \times 10^{-4} \text{ m [Circular]}$ <p>(b) </p> $\frac{mv^2}{r'} = qvB \sin \theta$ $\therefore r' = (2r) = 2 \times 9.95 \times 10^{-4} \text{ m. [Spiral]}$
74.	<p>(a) No. The force is experienced since they are aligned perpendicular to the current carrying conductor AB.</p> <p>(b) There is a force of attraction between AB and PQ and a force of repulsion between AB and SR.</p> <p>(c) PQ is closer to AB than SR, so the force of attraction is stronger than the force of repulsion. So, the loop begins to move towards AB.</p>
75.	<p>(a) Focal length by using the teacher's reading</p> $= \frac{1}{20} + \frac{1}{20} = \frac{2}{20} = \frac{1}{10}$ $\Rightarrow f = 10 \text{ cm}$ <p>(b) He should move his screen 3 cm farther from the lens.</p> <p>(c) Student 1 has kept his lens at F, the image would be at infinity.</p>

S.No.	Expected Answers
76.	(a) $A = -\pi, B = 2\pi$ (b) $I_{\min} : I_{\max} = (3 - 1)^2 : (3 + 1)^2 = 1 : 4$
77.	(a) Eyepiece is of shorter focal length / Image XY isn't between optical centre and F / Objective is having a larger aperture. (any two relevant points.) (b) A
78.	$H(X) \rightarrow \frac{n_2}{v} - \frac{n_1}{u} = \frac{n_2 - n_1}{R} = \frac{1}{H(X)} - \frac{3/2}{-24} = \frac{1 - \frac{3}{2}}{-40}$ $H(X) = -20 \text{ cm}$ $H(Y) \rightarrow \frac{n_2}{v} - \frac{n_1}{u} = \frac{n_2 - n_1}{R} = \frac{1}{H(Y)} - \frac{3/2}{-24} = \frac{1 - \frac{3}{2}}{40}$ $H(Y) = -13.33 \text{ cm}$
79.	(a) By conservation of energy, Change in K.E. + Change in P.E. = 0 or $\Delta K + q\Delta V = 0$ $\Delta V = -\frac{\Delta K}{q} = -\frac{\frac{1}{2}m(v^2 - u^2)}{q}$ $= \frac{\frac{1}{2} \times 6.64 \times 10^{-27} \times (25 - 6.25) \times 10^{12}}{3.2 \times 10^{-19}}$ $= -1.95 \times 10^5 \text{ V}$ (b) $E = \frac{\Delta V}{d} = 1.95 \times 10^6 \text{ V/m}$ (c) Particle accelerator/Linear accelerators/Atom smashers.
